Letter of Acceptance

Paper ID	Paper Title	Author(s)
ICECMSN-1883	Qubit Chat: A Controlled Evaluation of Grover-Inspired Reranking for Document Retrieval	Anishitha Kovvuri, Bala Rakesh Gundapaneni, Abdul Basith Syed, Jagadeeshbabu Borru, Naga Sravanthi Puppala

Decision: Acceptance with Major Revision

Herewith, the conference committee of the 6th International Conference on Evolutionary Computing and Mobile Sustainable Networks [ICECMSN 2026] is pleased to inform you that the above-mentioned research article has been **accepted** for presentation and publication in ICECMSN Conference Proceedings. ICECMSN will be held on 25-27, November 2026 at Hindusthan Institute of Technology, Coimbatore, Tamil Nadu, India.

We congratulate you on being successfully selected for the presentation of your research work in our esteemed conference.

Thank you
Yours Sincerely,

International Conference on ICECMSN Evolutionary Computing and Mobile Sustainable Networks

Dr. M. Duraipandian,
Conference Chair - ICECMSN-2026

IEEE

Technical Comments 1

The evaluation uses only two datasets, limiting the generalization of the findings to other document retrieval applications.

The Grover approach depends on classical cosine scores and candidate selection, reducing the potential quantum advantage.

The high P95 execution times of Grover simulation indicate potential performance limitations compared with classical retrieval methods.

The hardware specifications are incomplete, making the reported execution times difficult to reproduce precisely.

The proposed reranking method is not compared with more advanced neural or cross-encoder reranking techniques.

Please ensure that all figures are explicitly cited in the article text using consistent terminology and sequential numbering (e.g., “As shown in Fig. 1,” “Figure 2 illustrates,” etc.).

Redraft conclusion into a single paragraph in around 150-200 words.

Technical comments 2

The study should investigate alternative similarity thresholds to reduce the high fallback rate observed when no candidates satisfy the marking condition.

The ranking-score transformation should be optimized to preserve cosine-based relevance ordering while incorporating amplitude-amplification probabilities.

The circuit-resource analysis should evaluate the effects of increasing candidate-set size and score precision on qubit requirements, circuit depth, and simulation time.

The proposed approach should be compared with additional classical reranking methods to establish whether it provides measurable improvements over established retrieval techniques.

The proposed Grover-inspired reranking method should be evaluated on larger document collections to determine whether its retrieval performance scales beyond the SciFact and NFCorpus benchmarks.
